- ✓ **Message processing**
 - Mail filters provide an unique infrastructure for rich message processing of outgoing & incoming emails.
 - Multiple Rules and multiple Actions can be created for each email account.
 - Content Filtering - Set up rules to control your mail content, run applications, store to remote FTP folder, post to URL and much more.

- ✓ **Secure POP3**
 - Automatically download mails from other mail servers into local accounts through secure socket layer.

- ✓ **Secure SMTP**
 - Option to relay mails through SSL connection. This is useful when your ISP blocks default SMTP port (25).

- ✓ **Multi-threaded SMTP, Mail Relay Server**
 - Simultaneous deliveries to remote SMTP hosts

- ✓ **Logging/Reporting**
 - Per service log files, datewise, searchable.

- ✓ **Strong Security enforcement**
 - Restrict access to mail server with IP Restrictions, SMTP Authentication.
 - Allow/Deny access to services based on a single or a range of IP addresses

- ✓ **User Account Options**
 - Services availability per account: Userwise Permissions to services like pop3, imap, smtp, mail relay.
 - Random Password generation for new accounts
 - Mailbox Quota
 - Realtime display of mailbox quota used.
 - Display of last login time of the user account.
 - Import messages from zip file or from another account folder.
 - Mailbox message header viewer with Subject, Sender, Date, Size.
 - Save individual mails, Delete multiple emails from mailbox viewer.

✓ IMAP Email service

- **Manage mail folders remotely by e-mail & webmail clients that support IMAP protocol.**
- **Allows email access and management from more than one computer.**
- **Connected and disconnected modes of operation**

When using POP3, clients typically connect to the e-mail server briefly, only as long as it takes to download new messages. When using IMAP4, clients often stay connected as long as the user interface is active and download message content on demand. For users with many or large messages, this IMAP4 usage pattern can result in faster response times.

- **Multiple clients simultaneously connected to the same mailbox:**
The POP3 protocol requires the currently connected client to be the only client connected to the mailbox. In contrast, the IMAP protocol specifically allows simultaneous access by multiple clients and provides mechanisms for clients to detect changes made to the mailbox by other, concurrently connected, clients.
- **Messages & Folders Management**
Supports multiple mail folders in one user account. User can create, subscribe, unsubscribe, synchronize, delete and rename folder on their account.
- **Support for shared mail folders**

✓ Backup & Restore of Mail@Office server settings.

✓ Easy Backup & Restore of mailboxes. Userwise compressed backup of emails.

✓ System-wide global mail routing and mail filtering settings.

✓ News Ticker on the Webmail login screen for quick and easy information broadcast to the email users

✓ Built-in Intranet Webserver
